

FIR filter design with Julia

Matti Pastell

21th April 2016

1 Introduction

This an example of a julia script that can be published using [Weave](#). The script can be executed normally using Julia or published to HTML or pdf with Weave. Text is written in markdown in lines starting with `"#"` and code is executed and results are included in the published document.

Notice that you don't need to define chunk options, but you can using `#+`. just before code e.g. `#+ term=True, caption='Fancy plots.'`. If you're viewing the published version have a look at the [source](#) to see the markup.
